

THE IMAGINARIUM + KNOW THE LEDGER

A Technology, Creative Media & Entrepreneurship Development Initiative

GRANT PROPOSAL

EXECUTIVE SUMMARY

The Imaginarium is a creative-technology community built around exploration, learning, collaboration and implementation. Its public community materials describe an environment where participants work with artificial intelligence, art, automation, video, games, digital products and emerging technologies while moving from ideas into practical projects. The community is operated by Phillip Moreland and is described publicly as a combination of school, community, incubator and launchpad.

Know The Ledger (KTL) extends this technology and media ecosystem through a public-facing technology and Web3 information platform. Its public channel description identifies a focus on developments in technology and Web3 blockchain, including interviews with industry experts, explanations of complex technology topics, and resources intended to help people navigate a rapidly changing technology landscape.

Together, these activities create a foundation for a practical technology-and-creative development initiative: a place where emerging builders, creators, educators and entrepreneurs can learn, develop, produce, publish, collaborate and pursue sustainable economic opportunities.

ORGANIZATIONAL OVERVIEW

The Imaginarium provides the collaborative environment. Its current curriculum and programming includes **GIT INVEST**, with an emphasis on moving ideas toward practical development, intellectual property, business development, investment readiness and sustainable opportunities. **GIT BUILT** and **GIT MONEY** were previously part of the curriculum, providing earlier stages of the broader learning and development pathway. GitHub is also part of the development environment for organizing, documenting and advancing projects.

The Imaginarium emphasizes implementation rather than passive study. Participants can move through practical project development involving AI-powered websites and content services, GitHub, project management, business development, infrastructure, platform concepts and technical career development.

KTL contributes the technology-media and public-information dimension. Its documented YouTube presence centers on technology and Web3 education, interviews and explainers, providing a natural media channel through which emerging technology concepts and community-created work can be documented and shared.

STATEMENT OF NEED

The rapid development of artificial intelligence, digital media and software has lowered some barriers to creation while increasing the need for reliable infrastructure. A creator may have the concept, technical curiosity or business idea but still lack the computing power, software access, production equipment, storage, development environment and marketing resources necessary to turn that idea into a finished product.

The Imaginarium and KTL environment is positioned to address that gap by connecting learning with production. The need is therefore not limited to computers. It includes the complete infrastructure required to move from concept to working prototype, from prototype to public release, and from public release to sustainable participation in the digital economy.

ITEMIZED FUNDING REQUEST

Funding Area	Amount	Purpose	Resulting Capacity
Computing & AI Workstations	\$24,000	Four high-performance systems, approximately \$6,000 each, configured for AI, video, 3D, coding and creative workloads.	Dedicated production stations for creators, developers and technical projects.

Funding Area	Amount	Purpose	Resulting Capacity
Monitors & Peripherals	\$6,000	Monitors, docks, keyboards, webcams, external drives and related equipment.	Complete and efficient workstations.
AI / Cloud / Software	\$12,000	AI services, APIs, cloud computing, automation, development, design and video subscriptions.	Continuous infrastructure for building, testing and publishing.
Video Production	\$12,000	Cameras, lenses, lighting, tripods, microphones, storage and production accessories.	Professional film, educational, promotional and short-form content.
Podcast & Audio	\$6,000	Microphones, mixers/interfaces, headphones, acoustic treatment and recording/livestream equipment.	Podcast, interview, educational and community-media production.
Product / Web Development	\$10,000	Hosting, domains, databases, testing, deployment and technical support.	Movement of prototypes and digital concepts toward usable products.
Marketing & Outreach	\$10,000	Website improvements, branding, digital campaigns, social media, promotional content and outreach.	Audience development, partnerships and customer/revenue opportunities.
Workshops & Curriculum	\$7,000	Workbooks, curriculum development, guest expertise, demonstrations and hands-on implementation.	Repeatable learning experiences and completed participant projects.
Expansion Infrastructure	\$8,000	Workspace/production improvements, business systems and allowable expansion expenses.	Greater capacity for larger projects and more participants.
Reserve / Allowable Administrative Costs	\$5,000	Price changes, replacement needs and allowable administrative expenses.	Continuity of core activities and deliverables.
TOTAL	\$100,000	Technology + media + development + outreach	Integrated 12-month capacity build

PROGRAM DEVELOPMENT

The initiative can operate as an integrated pipeline: **learn** → **build** → **produce** → **publish** → **monetize** → **reinvest**. Participants can move from AI and technology education into practical project work, creative production, software development, media creation and business development. The current GIT INVEST curriculum reflects the movement from learning and implementation toward business development, intellectual property and funding readiness.

CREATIVE MEDIA & STORYTELLING

The media component supports documentation and distribution of the work being developed. Video, podcasting, interviews, educational programming and short-form content can make technical subjects accessible while giving creators a professional channel for demonstrating projects, telling stories and developing audiences. The KTL technology-media model provides an established channel for technology information through interviews and explanatory content.

INNOVATION & PRODUCT DEVELOPMENT

The initiative can support projects ranging from AI-powered websites and automation systems to games, digital products, films and community technology concepts. GitHub provides an important project-development environment for organizing code,

documentation, collaboration and continued development as projects mature.

ECONOMIC DEVELOPMENT

The objective is to help participants transform technical and creative skills into tangible economic activity. Products and services can be developed, tested, marketed and released; intellectual property can be documented; partnerships can be established; and successful projects can create pathways toward earned revenue, sponsorships, subscriptions, client services or additional investment.

12-MONTH IMPLEMENTATION

Quarter 1 — Infrastructure: establish computing, software, storage, production and development systems.

Quarter 2 — Creation: develop prototypes, media projects, digital products and workshops.

Quarter 3 — Launch: publish selected work, expand outreach, build partnerships and test revenue opportunities.

Quarter 4 — Scale: document outcomes, refine successful projects, strengthen sustainability and prepare follow-on opportunities.

MEASURABLE OUTCOMES

Measures may include computing stations deployed; AI/software tools maintained; prototypes completed; digital products launched; video and podcast productions completed; workshops delivered; participants completing implementation projects; repositories advanced toward deployment; audience/customer growth; partnerships established; revenue generated; and follow-on funding opportunities created.

SUSTAINABILITY

Long-term sustainability can combine community memberships, workshops, technology implementation services, creator services, digital products, media production, subscriptions, sponsorships, partnerships and intellectual-property revenue. The intent is for grant-supported infrastructure to increase productive capacity so that earned and partner-supported activity can progressively carry a larger share of operating costs.

CONCLUSION

The Imaginarium and Know The Ledger represent complementary parts of a technology-and-creative ecosystem: one centered on collaborative learning, experimentation and implementation, and the other on public technology media, information and communication. Investment in the underlying infrastructure can expand the ability to build, produce, publish and develop sustainable opportunities at the intersection of artificial intelligence, technology, media, art and entrepreneurship.

Organizational facts, budget quotations, legal structure and final performance metrics should be verified by Imaginarium/KTL leadership before submission.
