

Get Money: 5 Angles on the Proof Machine

Five genuinely different lenses on a single, radical thesis: **the moat isn't the curriculum — it's your ability to generate irrefutable proof of impact faster than anyone can copy.** Inside these pages, you'll find the arbitrage logic, the contrarian narrative, the curiosity framework, the competitive thesis, and the vivid opening scene that, together, tell the real story of Git Built, the NY Event, and the path to Investfest. Read all five. Then build the remix that hits hardest.

🎮 GROWTH PLAYBOOK

Executive Summary: The Real Game Being Played

Most course operators accept a grim reality: they break even on tuition, pray for word-of-mouth, and hope completion rates don't crater their reputation. Git Built is playing an entirely different game — and the sooner you internalize the distinction, the more clearly you'll see why this model compounds while others plateau.

The surface math looks familiar: ~\$10K operational cost, \$7K–10K in direct tuition. Break-even. But beneath that surface lies a layered arbitrage that transforms every student touchpoint into a durable asset. Content is produced at zero marginal cost as a byproduct of participation. Leads are qualified through immersion before they ever enter a sales conversation. And the proof — the undeniable, timestamped, screenshot-verified evidence of impact — becomes the moat competitors simply cannot buy.

These five angles aren't just rhetorical variations on the same pitch. Each one reframes the core insight through a different investor psychology: the quant who wants unit economics, the operator who recognizes pattern failure, the curious skeptic who wants to see receipts, the strategist who's thinking about defensibility, and the narrative investor who needs to feel the room before they write the check. Know your audience. Lead with the angle that lands.

Version 5

72 Hours in Harlem — Narrative momentum & vivid scene

"The House Always Wins"

Angle: Financial Arbitrage + Game Theory

The real insight isn't "teach students to make money on GitHub." It's this: **you've built a system where your margin is independent of student outcomes.** That's a fundamentally different business than a traditional bootcamp, and most people running courses never figure this out until it's too late to build the architecture.

Here's the math. Git Built costs you ~\$10K to run (team time + platform + merch). You collect \$7K–10K in direct tuition. So far: break-even or slight loss. That's what every course operator accepts and calls "sustainable." But then — and this is where the moat appears — those students generate content. They succeed, fail, pivot, iterate. All of it becomes clips, testimonials, case studies. That content costs zero to produce (students create it as byproduct) but it's worth thousands in social proof and conversion for Get Invested Phase 2.

What You Actually Collected

- **\$7K–10K** direct tuition revenue
- **~\$20K** in earned media content value
- **30+ warm leads** for the Get Invested pipeline
- **1 proof pattern** you can replicate infinitely

The NY Event Works the Same Way

\$10.2K in spend generates 50+ content pieces (retail value: \$5K+), 50 qualified email leads, and event footage that becomes your Investfest story. You win on volume, not individual unit economics.

This is why the **76% completion rate** matters strategically — not as a feel-good metric, but because completion = content, testimonials, and momentum. Higher churn = lower moat. The incentives are perfectly aligned.

"Our economics aren't dependent on student success — though we're proud of it. Our economics are dependent on *visibility* into that success. We've automated proof production."

"The Mistake Every Sovereign Builder Makes"

Angle: Story + Warm Contrarian Take

There's a pattern that plays out across thousands of talented builders. They create a bootcamp. They pour their knowledge in. They teach beautifully. And then they're shocked — genuinely shocked — when only 30% of students do anything meaningful with it, and 15% actually earn money. The instinctive diagnosis is always the same: *my teaching quality isn't good enough*. The real diagnosis is almost never that.

The real problem is simpler and more structural: **they didn't build evidence of impact into the delivery system itself**. Education and proof lived in separate rooms, and they never thought to knock down the wall. Git Built knocks down the wall from day one.

The mistake is treating education and proof as separate deliverables. You're building them as one integrated system: course + content machine + social proof factory. When a builder sees how you've woven these together, they don't just sign up — they become an evangelist. Because they're not buying a course. **They're buying visibility into a movement.**

"What Does Real Proof Actually Look Like?"

Angle: Question-Driven Curiosity

Most bootcamps measure completion: "Did you finish the four weeks?" Fair metric. Incomplete metric. The more demanding question — the one that changes how you build — is this: **Can you show me the exact moment someone went from "I don't know how to GitHub" to "I just earned \$200 on a bounty"?** Can you show me the videos, the Discord messages, the emails, the earnings screenshots? Can you show causality, not correlation?

Here's what happens when you build to that question. Every week of Git Built is designed to produce a specific artifact — not as an assignment, but as proof of a real state change in the learner.

1

Week 1 — Proof of Understanding

"Show me the 10 repos you evaluated." Not a quiz. Not a reflection essay. A set of decisions you made in the wild that demonstrate comprehension.

2

Week 2 — Proof of Execution

"Share your first fork, pending PR." Visible action. A thing that exists in the world that didn't exist before the student showed up.

3

Week 3 — Proof of Outcome

"Screenshot of bounty claimed or paid." Real money. Real timestamp. The gap between theory and result, closed on camera.

4

Week 4 — Proof of Mastery

"Your advice to the next cohort." The ability to teach back is the ultimate compression of learning. It's also your most credible recruitment asset.

Now you have a video documentary of learning, indexed by date and student. Not theory. Not testimonials. **Actual causality: this person did this thing and it caused this outcome.** That's rare. Investors don't want "we have happy students." They want a 90-second clip of a student showing their bounty payout, explaining exactly which repo they chose and why. That's sellable. That changes the conversation entirely.

"The Moat Isn't the Product"

Angle: Principle-Based Competitive Thesis

Every builder thinks their moat is their product. Better curriculum. More experienced instructors. Fancier platform. It's a natural instinct and an almost universal mistake. **The real moat is your ability to generate proof of impact faster than competitors can copy.** This distinction is everything — it changes what you measure, what you build, and how you pitch.

Think about what it would actually take to copy Git Built. The curriculum? Any developer could write that in a week. The Discord community? You can fork it overnight on another platform. The merch? Design is outsourceable. These are table stakes. None of them are defensible. What they can't copy is the flywheel that has been running and compounding through multiple cohort iterations.

Each cycle of that flywheel gets faster. Each cycle generates more proof. The third cohort converts at 85% because the proof is undeniable. The fifth cohort is oversubscribed because everyone has seen the pattern work repeatedly. Competitors can build a course. They cannot build a proof-generation engine that has been optimized five times over, because each optimization requires running the full cycle and measuring what worked. **That takes quarters, not weeks.**

📌 When you're pitching Get Invested and Investfest, investors aren't buying your curriculum. They're buying your ability to create irrefutable proof that what you teach works. The curriculum is table stakes. The proof machine is the moat.

This is why completion rate matters. This is why case studies matter. This is why filming everything matters. These aren't nice-to-haves or brand exercises. They are your competitive advantage, documented in real time, compounding with every cohort. The NY Event is the same thesis applied at scale — a proof-collection laboratory running for 72 hours straight, every session designed to capture irrefutable evidence of ideas spreading in a room.

"72 Hours in Harlem Changed Everything"

Angle: Narrative Momentum + Vivid Scene-Setting

It's August 1st, 2:00 PM. The ClauDE Gathering just kicked off. You've got 100 people in a room, livestream pushing it to 200 more online. Someone's sharing their first GitHub repo on the big screen. Another person just got a bounty notification while sitting in the audience — they screenshot it and post to Discord. **The energy in the room shifts. It's not theoretical anymore.**

By evening, Hitsuyo Aku is live-coding a solution to a real problem someone submitted at lunch. While he's doing it, he's narrating the principles. A woman in the back records it on her phone and shares the 30-second clip to her TikTok. Forty-seven hours later, it has 120K views. By Day 2, you've filmed 6 case studies. Students are talking about their repos the way artists talk about their paintings. There's a passionate debate about the best way to write a commit message — actual disagreement, captured on video. This is gold. This becomes your YouTube clip library for the next three months.

The Unexpected Moment

By Day 3, someone from the audience asks a question about taxes on bounty income. You don't have a slick answer ready. You say "I don't know — let me find out and email you." You actually do. By the next morning, you've recorded a 5-minute explainer and posted it in Discord tagged @ThatPerson. Five hundred people see it and save it. It lives in your resource library forever.

That moment of honesty — "I don't know, but I'll find out" — generates more trust than any polished production ever could. It proves the community is real, responsive, and alive.

What You Walk Into Investfest With

- 30+ Get Invested pre-registrations from the event + Git Built pipeline
- Video footage of 100 builders engaged in real time
- 50+ pieces of social content proving scale works
- 4 documented case studies of people earning real money
- Email list grown from 3,700 to 3,850+

You don't walk into Investfest with a pitch deck. You walk in with a story: *"Here's what happened August 1–3 in NYC. Here's what's happening now in Git Built. Here's where we're taking it next."* Not "we have a course." But **"we built a system that turns ideas into evidence into movement into capital."** That's the difference between a presentation and a proof.

Head-to-Head: Ranking the Five Angles

Not all five angles hit the same way for the same audience. Here's a clear-eyed ranking based on investor psychology, distinctiveness, and strategic impact — so you know exactly which version to lead with and when.

★ #1 — Version 4: The Moat Isn't the Product

Strongest overall. It's the insight that actually changes how you execute. An investor reads this and stops seeing completion rates as a vanity metric and starts seeing them as proof of competitive advantage. That reframe is rare and valuable. Lead with this when pitching sophisticated investors who think in terms of defensibility and compounding systems.

#2 — Version 1: The House Always Wins

Best for quantitative investors and operators. The arbitrage framing is intellectually satisfying and directly addresses unit economics skeptics. It shows you understand the business model at a structural level, not just a narrative one. Pair it with Version 4's thesis for a devastating one-two punch.

#3 — Version 5: 72 Hours in Harlem

Best opening scene for a live pitch. The August 1st scene-setting is visceral, specific, and credible. It makes the abstract tangible in 60 seconds. Use it as your opening hook before pivoting to Version 4's thesis — you've set the scene, now explain why it matters strategically.

#4 — Version 3: What Does Real Proof Look Like?

Best for operators and curriculum evaluators. The week-by-week proof artifact framework is concrete and actionable. It demonstrates systems thinking about evidence collection. Excellent for a second meeting or a written memo where readers have time to sit with the logic.

#5 — Version 2: The Mistake Every Builder Makes

Most relatable, least differentiated. This is the warm storytelling angle any course creator would produce. It's good. It's safe. It's what you'd write if you weren't pushing. Don't lead with this if you want to stand out — but use it as a supporting narrative for audiences who respond to empathy before logic.

The Recommended Remix

Combining the Best of Versions 1, 4, and 5 Into a Single Investor-Ready Narrative

The strongest single version borrows the arbitrage logic from Version 1, the core competitive thesis from Version 4, and the visceral opening moment from Version 5. Here's why this combination hits hardest: it opens with a scene that makes investors feel the momentum, escalates into a structural insight that makes them rethink the category, and closes with a principle-based argument for defensibility. It's emotionally compelling and intellectually rigorous at the same time — the rare combination that sophisticated early-stage investors respond to.

The remix should open with the August 1st scene — specific, vivid, present tense. Let investors feel the room before you explain the business. Then pivot to the arbitrage math: "Here's what that 72 hours actually generated in dollar-value assets." Then close with the principle: "None of that is replicable in a quarter. That's the moat." Each section earns the next. You're not arguing; you're demonstrating. By the time you reach the competitive thesis, the investor has already felt, seen, and understood the proof. The thesis just names what they already believe.

- ❏ Structure your Investfest pitch in exactly this order: Scene → Math → Principle. It mirrors how conviction actually builds in an investor's mind.

Why the Proof Machine Scales Infinitely

The Strategic Case for Get Invested, Investfest, and Beyond

The proof machine thesis isn't just a clever way to explain Git Built — it's a scalable architecture that applies identically to every phase of the Get Money ecosystem. Get Invested isn't a separate product; it's the next loop of the same flywheel. The 30+ warm leads generated by Git Built and the NY Event don't need to be sold to. They've watched the proof accumulate in real time. They've been inside the Discord. They've seen the bounty notifications ping. They arrive at Get Invested already converted — they're just looking for confirmation that the next level is real.

This is the strategic unlock that changes the economics at every phase. Each product in the pipeline doesn't start from zero — it inherits the proof generated by the previous product. Git Built generates proof that GitHub bounties are real income. Get Invested inherits that proof and layers on: "And here's what happens when you take those earnings and build a service business." Investfest inherits all of it and layers on: "And here's what happens when you take that service business and attract institutional attention." **Every phase adds a layer of proof. The compound effect is extraordinary.**

Competitors can copy your curriculum at any single layer. They cannot copy the compound proof that spans three layers and multiple cohort cycles. By the time a competitor has finished building their version of Git Built, you've already proven Get Invested at scale. **The moat widens automatically as long as you keep running the machine.**

The Pitch in One Paragraph

The closing argument. Memorize this. Say it out loud until it's natural.

"On August 1st in Harlem, 100 builders watched a bounty notification ping live on someone's laptop. That moment wasn't an accident — it was designed. We built Git Built to produce that moment, film it, amplify it, and let it pull in the next cohort. Here's the math: \$10K in, and we collected \$7K–10K in tuition, \$20K in earned media, and 30 warm leads worth \$100–500 each in downstream revenue. Not because we got lucky — because we built a proof-generation engine, not a course. Our competitors can copy the curriculum in a week. They cannot copy five cohorts of compounding evidence. The moat isn't the product. The moat is our ability to turn every student outcome into irrefutable proof that this works. That proof gets stronger every cycle. We're raising to run more cycles."

Lead With

Version 4 thesis for sophisticated investors who think in defensibility

Open With

Version 5 scene for live pitches where you need to capture the room fast

Close With

Version 1 math for anyone who needs to see the unit economics before they believe the narrative

Use Version 2 & 3 For

Supporting material, nurture sequences, and audiences who respond to empathy + evidence before principle

You're not running a course. **You're running a system that turns ideas into evidence into movement into capital.** Go build the proof. The machine is already running.
