COMMON UNITY INITIATIVE

THE C.U.I. 3D WORLD

Investor Brief — What It Is, What's Built, Where It Goes

F.A.C.T.S. Initiative created by RED PILLAR · Game built by Quantum Melanin Media

September 2026

"We stay ready so we ain't gotta get ready."

THE ONE-MINUTE VERSION

The block on your screen is practice. The Common Unity Initiative is the real one.

C.U.I. is a walkable 3D community-preparedness game. You and your neighbours build a block that feeds, clothes, powers, shelters and entertains itself — and then a crisis hits (a grid failure, an ice storm, a water main break) and you find out whether any of it was real.

It is the game version of a real movement. **The Common Unity Initiative is being carried out on the ground right now**, organised around RED PILLAR's **F.A.C.T.S.** framework: **Food · Art · Clothes · Tech · Shelter**. The game teaches that framework by making people *live* it.

What it is	A third-person 3D world that runs in the browser — desktop and phone, nothing to install
Who it's for	Communities, classes and families who want to get ready together
What makes it different	Real crises tied to real-world odds, real how-to steps in every building, and no money — only community labour
Where it stands	Built, tested and played by a class. Public launch is the next step
What it does for the initiative	Teaches the framework, and walks players through the door into the real community

THE PROBLEM

Most preparedness content is fear, gear and going it alone: buy a bunker bucket, stock a basement, trust nobody.

That is not how communities actually make it through. When the grid goes down and nobody is coming, the people who hold up are the ones who **already know their neighbours, already grow something, and already share**.

C.U.I. was built after watching exactly that happen — **communities in Indiana left on their own in a power crisis**. The lesson was simple: *the city can go dark. Your block does not have to.*

The hard part is not information. The hard part is getting people to **practise** — to build the habit of working together *before* they need it. So we built a game that points at the real thing.

WHAT C.U.I. IS

One game, three jobs

1 · A WORLD PEOPLE ACTUALLY WANT TO BE IN

Walk your land. Raise a fire circle. Ride the ATV out to a dead substation. Take a drone up over the block at night. Step inside your own house when the rain comes. If it isn't fun, nothing else works — so it is built to be played, not to lecture.

2 · A TEACHING TOOL

Every one of the **39 buildings** carries a **"Do It For Real"** note — the actual first step a person could take this week. *"Four hens ≈ 18 eggs a week; check your city ordinance."* *"Roll a wet coil of your soil — if it bends into a ring without cracking, you have brick clay."* A player who never opens the game again still walks away knowing something useful.

3 · A FRONT DOOR TO THE REAL INITIATIVE

The game's doors lead straight into the real community: **72 K.L.A.W.S · IMAGINARIUM · RED PILLAR on Patreon · A GAME Herbal Remedies · KTL University**. When a player walks through a door and comes back, the game rewards their block — because a person who actually joins the real community is exactly the kind of labour the game is about.

F.A.C.T.S. — THE FIVE PILLARS

Created by RED PILLAR. Every building, every crisis and the score itself hang off these five.

	Pillar	In the world
F	FOOD	Gardens, coops, root cellars, a clean spring. Grow it, store it, don't depend on a shelf.
A	ART	Drum circles, griot stands, recording booths. Households use up art every day, like food — run out and people leave.
C	CLOTHES	Fiber, dye, loom, sewing co-op. Clothe your own.
T	TECH	Solar, batteries, micro-hydro, radio, drones. Power built from the ground up.
S	SHELTER	Houses, fire circles, a freedom school. Roof, water, warmth.

Under all five sit two resources from the land itself — **FLORA** (seed, fiber, herb, timber) and **MINERAL** (clay, ochre, copper, salt). No flora, no loom. No mineral, no kiln. You cannot be ready on stripped land, however full the shelves look.

A community that stops making music and story loses its people just as surely as one that stops eating.

HOW IT PLAYS

The core loop

A NEIGHBOUR ASKS

The heart of the game.

Named neighbours with real trades — herbalist, welder, griot — come to you short on something. **Give it, roll up your sleeves** and go work at their house, **send a drone**, or send water from the spring. Help builds standing.

THE BLOCK GROWS

Standing becomes strength.

Neighbours you've helped show up to raise your buildings, trade you their goods, and guard the block when trouble comes.

A CRISIS LANDS

The test.

Ice storm. Heat dome. Grid failure. Water main break. Supply chain halt. Soil contamination. Production craters, and you live on what you stored.

HOLD THE LINE

The payoff.

Keep every pillar above zero and the whole block is rewarded. Run one dry and households leave. Build your own power, and when the city goes dark, **your block stays lit.**

There is no money

The only currency is **UNITY — community labour**. You cannot buy it, and no machine makes it. You earn it by helping neighbours, carrying the block through a crisis, and joining the real initiative. The game teaches, through play, that **people are the resource**.

WHAT MAKES IT DIFFERENT

1 · Crises follow the real world

Which crisis hits your block — and how much calm you get between them — is weighted by **odds from real prediction markets** (Polymarket, read-only). When the real world prices a grid emergency higher, your block feels it.

The in-world **Control Room** shows the actual market question behind every crisis, so players can check it for themselves. Nothing is traded, and no crisis is wished for.

Seasonality comes free: ice-storm markets don't exist in August, so the crisis mix drifts with the real calendar on its own.

2 · The block keeps living while you're gone

Close the game and your block keeps going. Come back to a report: what grew, what ran low, who moved in, who left, and whether a crisis hit while you were out. That is what turns a session into a daily habit.

3 · It points at real action

39 buildings, 39 real-world first steps. The world is practice for things a person can actually do on their own street.

4 · It looks like us

Deep, melanated characters with natural hair — locs, afros, braids, head wraps. Players build themselves in the character creator, or walk as QMM hosts **Quantus** and **Tess**. The soundtrack is original music.

INSIDE THE WORLD

The homestead at midday — your house, the motor pool under its solar rack, and the quest line walking a new player through their first week. The five F.A.C.T.S. reserves sit top-right.

A grid failure. A block with no power of its own goes dark with the city — build solar, batteries and micro-hydro, and it doesn't.

The core verb. RED PILLAR is short on food — give it, send a drone, or send water from the spring. The build drawer is open on the right.

Drone view. The block's drones — built in the story by the technical school's students — can be flown by hand, sent on patrol, or used to deliver goods.

The Control Room. Real-world odds with the real market question under each crisis, the block's power grid, and the charge on every vehicle.

WHAT'S BUILT TODAY

Area	What's in it
World	A compound around a Town Square and Town Hall, member lots, a clean spring with a micro-hydro wheel, six dead substations out on the range, and a city skyline you can walk toward
Day & weather	A full day/night cycle, rain, and a living layer — birds by day, fireflies after dark
People	Named neighbours with trades, standing, work orders, barter and block parties
Your house	A home you can walk inside — a separate interior, not a painted door
Economy	Unity (community labour) as the only currency; 39 buildings across five pillars and two land resources
Crises	Six crisis types, weighted by real-world odds
Machines	Rideable ATV, two electric dirtbikes and a tractor — running on charge from what the block generates. Run flat and you limp home
Drones	Three flyable drones — patrol, sweep, deliver goods — commanded from the Control Room
Player	Character creator with melanated skin tones and natural hairstyles; play as Quantus or Tess
Onboarding	An eight-step quest line that watches play and ticks itself off
Platforms	Browser on desktop, plus phone controls — an on-screen stick and button pad
Audio	Original soundtrack that shifts by day, night and crisis
Quality	233 automated checks run against the 3D build

Early player signal

The 3D world was shared with a class and played. One player wrote a five-point improvement brief — **four of the five systems he asked for were already in the game**. That told us the depth is there, and that some of it needs to be easier to find. That is now on the roadmap.

WHERE IT GOES

Near term — launch

- **Public launch** — put the 3D world on the web for anyone with a link
- **Mobile polish** — the phone controls exist; tighten them for real hands
- **Surface the depth** — make the systems players are missing easier to find

Next — connect the game to the real block

- **Block Tracker** — households log what they *actually* have stocked, so the block in the world mirrors the real neighbourhood. This is the step that turns a game into a community tool.
- **Neighbour blocks** — separate blocks send surplus up the street to each other
- **Companion app + website** — one ecosystem across the game, the community and the initiative
- **Video gallery** — short-form video from the community, inside the ecosystem (requested by RED PILLAR)

Later — grow the curriculum

- Deeper plant and mineral knowledge — species-level herb and pigment work
- More "Do It For Real" content, reviewed by people carrying out the initiative

PATHS TO REVENUE

Honest framing: the game has not earned money yet. These are the models on the table for discussion — not results.

Path	How it would work
Community membership	The game is a front door into paid communities that already exist — Patreon, Skool, KTL University. Every player who walks through is a potential member.
Group licensing	A private block for a school, church, youth program or organisation — their own members, their own tracker.
Education & workshops	The game as the hands-on piece of a preparedness course; "Do It For Real" steps become real-world workshops.
Partners	Seed, solar, water and tool partners placed inside the real how-to notes where the recommendation is genuine.
Premium content	Expansion districts, crises and deeper plant/mineral chains.

WHAT INVESTMENT WOULD FUND

- 1. Launch** — public release of the 3D world, hosting, mobile polish
- 2. The Block Tracker** — the bridge from the game to the real neighbourhood
- 3. Content** — more buildings, crises and verified real-world guides
- 4. Community rollout** — getting the game into the hands of groups, classes and chapters of the initiative
- 5. Companion app & ecosystem** — one connected home for the game, the community and the video gallery

HONEST STATUS

Area	State
Core loop — help, build, stock, hold the line	Working
39 buildings with real-world how-to notes	Complete — content under review by the initiative
Real-world crisis clock	Working — 4 of 6 crises tied to markets
Offline progression	Working — numbers still being tuned
3D world	Built and class-tested — not yet publicly launched
Long-run balance	Tested in short sessions, not yet across real weeks of play
Revenue	None yet
Block Tracker / companion app	Planned, not built

The world is built. The movement is real. What's next is putting the two in the same hands.
